

Introduction to course and to R

Leo Schalkwyk

June 2, 2011

What is R and why does it have such a silly name?

- ▶ <http://en.wikipedia.org/wiki/R> - what the encyclopedia says
- ▶ descended from S, developed at Bell Labs (home of C)
- ▶ S was developed by John Chambers, described in several books

R is an implementation of S

- ▶ so is S-Plus (a commercial product)
- ▶ the two are very similar
- ▶ we have a site license for S-plus and you could use it identically
- ▶ I'll mention the few differences between R and S-plus as we come to them

Why (not) use R

- ▶ +very powerful computing environment for data analysis
- ▶ +under active development by enthusiastic volunteers
- ▶ +lots of specialised software packages available
- ▶ +you can distribute your own code
- ▶ +superb graphics capabilities
- ▶ -hard to get started
- ▶ -documentation style requires getting used to
- ▶ -aimed at statisticians

Why (not) use S+

- ▶ +very powerful computing environment for data analysis
- ▶ +under active development by a company
- ▶ +lots of specialised software packages available
- ▶ +superb graphics capabilities
- ▶ +some help in getting started from menus
- ▶ -you can distribute your own code but others need S+ to use it
- ▶ -R packages will probably run but need to be ported

What are the characteristics of R

- ▶ command line interface similar to unix shell
 - ▶ somewhat C - like syntax
 - ▶ command-line editing
 - ▶ online help in man-page tradition
- ▶ programming environment designed for interactive use
- ▶ functional programming language similar to scheme
- ▶ object oriented features
- ▶ high and low level graphics

Installation of R

- ▶ <http://www.r-project.org>
- ▶ <http://www.stats.bris.ac.uk/R/>

Functions

- ▶ functions are the only way of making something happen
- ▶ `name(args)`
- ▶ easy to define your own:
 - ▶ `myfu <- function (a,b) {a+b}`
- ▶ args may not be required but `()` are always required
 - ▶ `sum(1,2)`
 - ▶ `q() # quit R`
 - ▶ `q # print q function`
- ▶ the basic arithmetic operators are convenience exceptions
 - ▶ `'+'(1,2)`
 - ▶ `1+2`

Playing with R: basic arithmetic

- ▶ if you type in an expression R will evaluate and print-
- ▶ `5*2`
- ▶ `5^2`
- ▶ `100%%3`
- ▶ `100%%3`
- ▶ multiply and divide come before add and subtract

vectorise me!

- ▶ variable names start with a letter
- ▶ assign values to variable names with `<-`
- ▶ basic data structure is the vector
- ▶ `a <- 1:100`
- ▶ `b <- c(1,0)` # `c` is a function that combines its arguments
- ▶ all of the basic functions work on vectors
- ▶ `a + 0.5`
- ▶ `a + a`

recycling

- ▶ operations on vectors of unequal length recycle the shorter one
- ▶ `a <- 1:100`
- ▶ `b <- c(1,0)`
- ▶ `a + b` # add 1 to odd numbered positions only

indexing: index vectors

- ▶ `a[50]` # 50
- ▶ `a[-50]` # everything but 50
- ▶ `a[100:1]` # backwards
- ▶ `a[c(1:100,100:1)]` # count down then up
- ▶ `a[1:10*10]` # every tenth number

indexing: logical vectors

- ▶ `b <- a%%2==1`
- ▶ `a[b]` # odd only

Exercises:

- ▶ calculate the sum of odd numbers up to 1000
- ▶ what's the largest multiple of 13 under 1000
- ▶ calculate pi using the Gregory-Leibniz series
